# project**five**

Two Factor Authentication

or 2FA as it is often referred to

2FA is the method in which you are only granted access to your PC or accounts **after** you have successfully given **two pieces of evidence** to prove you are who you say you are.

Code: 481 609

Enter code: _____

2FA is a security process, which means your account is much better protected.

Part 1 of 2FA: enter your password into your PC or account.

jane.smith@projectfive.co.

Enter password

****

Part 2 of 2FA: Open the authentiction app. You need to enter this code on your PC or account.

Code: 481 609

jane.smith@projectfive.co.uk

Enter code

481 609

Using 2FA in your organisation means you are much **less vulnerable** to a **Cyber Attack**.

If a hacker manages to obtain your password, they are less likely to be able to access your account, unless they also have your mobile phone.
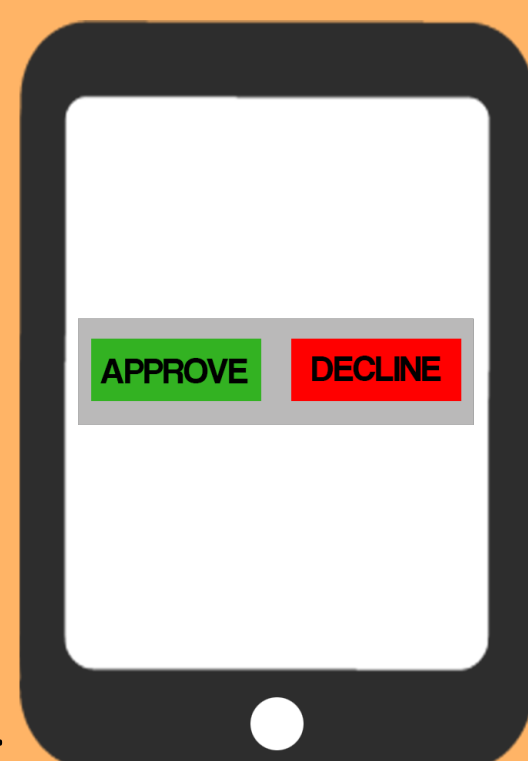

jane.smith@projectfive.co.uk

Enter code

You can set it up to remember you, but if you login on a different device you will be asked for the second part of the 2FA again. Also...

Microsoft

will **re-request** the second part of the authentication every **few weeks**, as an extra **security feature**.

You have the option to set up 2FA to pop up on your phone and ask you to **approve** or **decline** the login request. This may seem easier, but the **code option** is much **safer** and **recommended**.

APPROVE   DECLINE

At **project**five we use Two Factor Authentication. It is an extra security blanket and another way to help prevent a potential cyber attack for your business.

For more information, or if you would like to implement it into your business, get in touch with our friendly team.
